

FDP3-Modbus Interface v1.05

Installation and Operating Instructions

Mounting

The FDP3-Modbus can be mounted horizontally or vertically.

TCC-NET Network

TCC-NET Terminals A, B connect to the Toshiba TCC-NET remote controller network. The FDP3 is powered from this connection and communicates with the indoor unit on this network. The FDP3 can be connected together with one Toshiba remote controller.

Networking

NETWORK INSTALLATION

The RS485 D-Bus network requires a twisted pair cable connecting terminals DB(+) and DA(-) on each FDP3 as shown below. Terminal DB must be connected to all other DB terminals. Terminal DA must be connected to all other DA terminals. In addition the common terminal GND on all devices must be connected together. If a shielded cable is used then the shield can be used for this purpose. The network must be installed as a daisy-chained point-to-point Bus configuration, Star and Ring connections must NOT be used.

SPECIFICATION

Use stranded 24awg shielded or unshielded twisted pair to Cat3, Cat4 or Cat5 specification. Use a twisted pair for connections DB,DA and an extra core for connection GND.

NETWORK LENGTH

Standard installation for total network distances of up to 500m can be achieved following the basic daisy-chaining method showed in the above diagram. Network termination should not be necessary for networks of this length. The network can be extended further using RS485 repeaters.

NETWORK DEVICE COUNT

Each FDP3 has half a standard RS485 network load. An RS485 network can have a maximum of 32 standard network loads. Assuming the Modbus master is a standard network load then a maximum of 62 FDP3 devices can be placed on a single physical network.

ADDRESSING

Each FDP3-Modbus must have a unique Modbus network address in the range 0 to 63 using DIP switches SW1.3 to SW1.8. A table of switch setting is given on the last page of this datasheet.

FDP3-Modbus Description

The FDP3-Modbus is a low cost Modbus based monitoring and control interface for Toshiba VRF and Split ranges of air-conditioners. The interface is compatible with all units that have a TCC-NET A,B remote controller network connection. No other network adaptor cards are required even for split A/C units.

Functions

UNIT CONTROL. Control of Setpoint, Fanspeed, Runmode, Louvre mode and on/off state through Modbus registers.

REMOTE CONTROLLER Facility to individually lock and unlock each remote controller button associated with unit control.

FAULT CODES. Readback of all indoor and outdoor unit fault codes

UNIT TEMPERATURES Indoor unit air and coil temperatures is available

RS485 NETWORK Multiple FDP3-Modbus interfaces can be networked on an RS485 network to provide control of multi zone systems.

Warnings and Cautions

Do not exceed the specified fault relay ratings

Observe precautions for handling Electrostatic Sensitive Devices

Modbus Protocol

MODBUS CONFIGURATION

| | |
|----------------------|------------------|
| Network | 3 wire RS485 |
| Mode | Modbus RTU Slave |
| Baud | 9600 |
| Parity | None |
| Stop bits | 1 |
| Register Base | 0 |

Note: FDP3 interfaces can be configured with different baud rate and parity settings if required

MODBUS REGISTERS

The FDP3-Modbus supports two types of register, analogue *Holding Registers* and analogue *Input Registers*. Register Addresses are '0' based in the range 0..65535.

| Register Type | Access | Function |
|-------------------------|------------|-----------------------------------|
| Holding Register | Read/Write | Control and Command Registers |
| Input Register | Read Only | Readback and Monitoring Registers |

All analogue and digital values are accessed through these registers. All register values are 2 byte (16 bit) values.

Different data types are returned using specific conventions

| Data Type | Range | Convention |
|--------------------|----------|--|
| Digital | 0..1 | 0=FALSE, 1=TRUE |
| Integer | 0..65535 | No scaling required |
| Temperature | 0..65535 | Temperatures values are generally returned <i>multiplied by 100</i> to allow greater precision. To allow for negative temperature the value is returned as a <i>signed integer</i> , this means that any value greater than 32767 must be converted into a negative value by subtracting 65536. Examples: A readback value of 2150 is a positive temperature so: 2150 / 100 = 21.50°C A readback value of 65036 is a negative temperature so: 65036 - 65536 = -500 -500 / 100 = -5.00°C |

Registers are accessed using standard Modbus functions. The following four functions are supported by the FDP3 interface.

| Function Code (hex code) | Function Name | Register Count |
|--------------------------|----------------------------------|----------------|
| 03 (03h) | Read Holding Registers | 1..10 |
| 04 (04h) | Read Input Registers | 1..10 |
| 06 (06h) | Preset Single Holding Register | 1 |
| 16 (10h) | Preset Multiple Holding Register | 1..10 |

In this document, Holding registers are written as **H0010** where 'H' indicates *Holding* register and '0010' indicates the register address 0010. Similarly Input registers are referred to as **I0010** where 'I' indicates an *Input* register.

Control Functions

CONTROL

The FDP3-Modbus can be used to control all of the operating functions of the air-conditioning system that are available from a standard remote controller. All control registers are analogue Holding Registers.

| Holding Register | Name | Range |
|------------------|----------|--|
| H0001 | Setpoint | 10..40 |
| H0002 | Fanspeed | 0..3 (0:Auto, 1:Low, 2:Medium, 3: High) |
| H0003 | Mode | 0..4 (0:Auto, 1:Heat, 2:Fan, 3:Cool, 4:Dry) |
| H0004 | Louvre | 1..7 (1:Swing, 2: 0 Degrees, 3: 20 Degrees, 4:45 Degrees, 5:70 Degrees, 6:90 Degrees) |
| H0005 | OnOff | 0..1 (0:Off, 1:On) |

CONTROL UPDATE MODE

Each control field has a corresponding Update Register which determines how the control commands update the unit and if the corresponding remote controller button(s) are locked or unlocked. Four update modes are available:

| Update Mode | Keypad Button(s) | Functionality |
|-------------|------------------|---|
| 0:LastTouch | Unlocked | Unit setting is updated when a holding register WRITE occurs even if the value is unchanged. |
| 1:Central | Locked | The corresponding keypad buttons are locked. The value in the holding register is repeatedly written to the unit. |
| 2:Local | Unlocked | Updates to holding registers are not sent to the unit. |
| 3:OnChange | Unlocked | Unit setting is updated when a holding register WRITE occurs only if the value CHANGES. |

The *Last Touched* update mode allows updates from the Keypad or Modbus registers. This requires that WRITES to the Modbus holding register only occur when a change is made. If the Modbus master repeatedly writes the value then this will overwrite the user setting. The *On Change* update mode can be used if repeated writes occur, in which case updates are only sent to the AC unit if the written value changes.

The *Global Update* register H0010 can be used to set all update registers with one command, or the individual registers can be written to.

| Holding Register | Name | Lock Mode* |
|------------------|-----------------|---|
| H0010 | Global Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |
| H0011 | Setpoint Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |
| H0012 | Fanspeed Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |
| H0013 | Mode Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |
| H0014 | Louvre Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |
| H0015 | OnOff Update | 0:LastTouch, 1:Central, 2:Local, 3:OnChange |

*Last Touch updates are written to the A/C on every register write. On Change updates are only sent if the value written changes. Central locks the corresponding RC button. Local unlocks the RC button and prevents any updates from the FDP3.

The default settings on power up are all fields in Last Touch mode.

CONTROL LIMITING

The Control Limit registers allow adjustment from the remote controller or central controller to be limited to specified ranges. The setpoint can be optionally limited to minimum and maximum specified values. Fanspeed, Mode and Louvre settings can also be limited to specific settings using an inhibit value. If the limit values are set to 0 then no limit is applied.

| Holding Register | Name | Range |
|------------------|------------------|------------------------------------|
| H0020 | Setpoint Min | 18..31, 0 = No Limit |
| H0021 | Setpoint Max | 18..31, 0 = No Limit |
| H0022 | Fanspeed Inhibit | 0 = No Inhibit, else Inhibit Value |
| H0023 | Mode Inhibit | 0 = No Inhibit, else Inhibit Value |
| H0024 | Louvre Inhibit | 0 = No Inhibit, else Inhibit Value |

Fanspeed, Mode and Louvre inhibit values are calculated by adding the inhibit values for each setting to be inhibited. The values are as follows

Fan Inhibit

| Fanspeed | Inhibit Value |
|----------|---------------|
| Auto | 1 |
| Low | 2 |
| Medium | 4 |
| High | 8 |

Mode Inhibit

| Run Mode | Inhibit Value |
|----------|---------------|
| AUTO | 1 |
| HEAT | 2 |
| FAN | 4 |
| COOL | 8 |
| DRY | 16 |

Louvre Inhibit

| Louvre Position | Inhibit Value |
|-----------------|---------------|
| Swing | 2 |
| 0 Degrees | 4 |
| 20 Degrees | 8 |
| 45 Degrees | 16 |
| 70 Degrees | 32 |
| 90 Degrees | 64 |

Examples:

To limit the Mode setting to Heat, Cool and Fan:

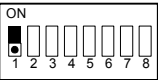

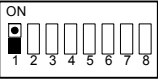

$$\begin{aligned} \text{Mode Inhibit Value} &= \text{AUTO} + \text{FAN} + \text{DRY} \\ &= (1 + 4 + 16) \\ &= 21 \end{aligned}$$

To limit the Louvre setting 0 Degree, 20 Degrees, 45 Degrees:

$$\text{Louvre Inhibit Value} = \text{Swing} + 70 \text{ Degrees} + 90 \text{ Degrees}$$

MODBUS MASTER TIMEOUT

The FDP3-Modbus can be configured to operate with an optional Modbus Master timeout. In this configuration if no Holding Register writes occur for a period of 120 seconds then a timeout event will occur and all A/C units will be switched on with their current settings. In a timeout condition the FDP3 Leds will indicate an *RS485 Communications Timeout* as illustrated in the *LED Functionality* section of this datasheet. FDP3 DIP Switch settings to enable or disable Modbus Master Timeout are shown in the following table.

| Switch Setting | Function |
|---|---|
|  | No Timeout |
|  | Timeout if no Holding Register WRITE command for 120 seconds. All units switched ON with current settings. Remote controllers UNLOCKED. |

Readback Data

All readback data is available in analogue Input Registers.

GROUP READBACK

Group data registers provide a summary of the data from all active indoor units on the network.

| Input Register | Name | Range | Notes |
|----------------|--------------------|-----------------|--|
| 10020 | Unit Count | 0..16 | Number of units found on network |
| 10021 | Is Fault | 0..1 | 0:No Fault, 1: At least one unit in fault |
| 10022 | Fault Code | 0..65535 | 255: No Fault, else fault code from first unit in fault |
| 10023 | Return Air Average | Degrees C x 100 | Average of all unit return air temperatures |
| 10024 | Filter Alarm | 0..1 | 0: No Alarm, 1: At least one unit with filter alarm |
| 10025 | Return Air Min | Degrees C x 100 | Minimum of all unit return air temperatures |
| 10026 | Return Air Max | Degrees C x 100 | Maximum of all unit return air temperatures |
| 10030 | Thermo On | 0..3 | Summary of unit operation 0:Idle/Fan, 1:Heating, 2:Cooling, 3:Heat and Cool |
| 10035 | Defrost | 0..1 | 0: No defrost, 1: At least one unit in defrost |

REMOTE CONTROLLER READBACK

| Input Register | Name | Range |
|----------------|----------------|--|
| 10050 | RC Temperature | Degrees C x 100 (only available for 1 indoor unit) |
| 10052 | RC Exists | 0: No RC, 1: RC Available |

UNIT READBACK

Unit data is available for each of the indoor units on the network. Unit Input registers are numbered using the indoor unit numbering in the range 1 to 8 x 100 added to an offset relating to a specific feature.

| Unit 1 | Unit 2 | ... | Unit 8 | Name | Range | Notes |
|--------|--------|-----|--------|------------------------|-----------------|------------------------------------|
| 0120 | 0220 | ... | 0820 | Unit Exists | 0..1 | 0: No Unit Found, 1: Unit Found |
| 0121 | 0221 | ... | 0821 | Is Fault | 0..1 | 0: No Unit Fault, 1: Unit in Fault |
| 0122 | 0222 | ... | 0822 | Fault Code | 0..65535 | 255: No Fault, else fault code |
| 0123 | 0223 | ... | 0823 | Return Air Temperature | Degrees C x 100 | Unit Return Air Sensor Value |
| 0124 | 0224 | ... | 0824 | Filter Alarm | 0..1 | 0: No Alarm, 1: Filter Alarm |
| 0130 | 0230 | ... | 0830 | Thermo On | 0..2 | 0:Idle/Fan, 1:Heating, 2:Cooling |
| 0131 | 0231 | ... | 0831 | Coil TC* Temperature | Degrees C x 100 | TC Coil Temperature (*TC2 for VRF) |
| 0132 | 0232 | ... | 0832 | Coil TCJ Temperature | Degrees C x 100 | TCJ Coil Temperature |
| 0134 | 0234 | ... | 0834 | Indoor Duty | 0..15 | Unit Duty 0..15 = 0..100% |
| 0135 | 0235 | ... | 0835 | Defrost | 0..1 | 0:Unit Operating, 1:Unit Defrost |
| 0142 | 0242 | ... | 0842 | Line address | 1..32 | |
| 0143 | 0243 | ... | 0843 | Unit address | 1..32 | |

Fault Codes

FAULT CODES

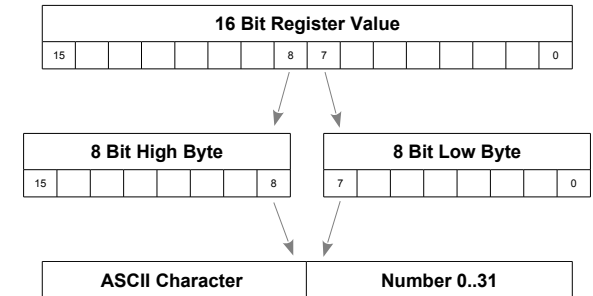

Fault codes are encoded using a standard table to allow standard Toshiba fault codes to be generated from the readback value. The **no fault** value is 255.

Special fault codes generated by the FDP3 are as follows

| Code Value | Meaning |
|------------|--|
| 0 | Waiting for data |
| 255 | No Fault |
| 14384 | (80) Group Fault, timeout on no units found |
| 14388 | (84) Unit Missing, reported if unit data previously observed |

All other codes are Toshiba fault codes. The full table of fault code values is available from <http://www.realtime-controls.co.uk/>

Fault codes returned from a Modbus Input register are 16 bit values. The fault code is encoded in the 16 bit value by encoding the two 8 bit fault fields in the high and low byte parts of the 16 bit value. The high byte represents an ASCII text character and the low byte is a decimal value in the range 0 to 31. The low byte value is written as two digits, so e.g. 9 is written as 09.

Example:

A fault code value of 17668 is returned.

HighByte(17668) = 69 = ASCII Character 'E'

LowByte(17668) = 4 = Decimal Code 04

Fault Code: 'E04'

Modbus Addressing

The Modbus Address of the FDP3 is set with the 6 right dip switches on SW1. The address range is 0 to 63.

Diagram illustrating the Modbus Addressing configuration for addresses 0 through 63. Each address is represented by a set of 8 dip switches (labeled 1 through 8). The address is determined by the state (ON/OFF) of the 6 rightmost dip switches (3 through 8).

LED Functionality
